

## PHASE 2 – REQUIREMENT ANALYSIS

# Customer Journey Map

| Field         | Details                                        |
|---------------|------------------------------------------------|
| Team ID       | 6ab4c3e86603573ccfb5068c                       |
| Project Name  | Auto Ticket Classification using Flow Designer |
| Platform      | ServiceNow                                     |
| Maximum Marks | 4 Marks                                        |

### 1. Purpose

The customer journey maps the experience from identifying an IT problem through ticket creation, automated classification, acknowledgement and helpdesk handling.

### 2. Customer Journey Map

| Stage              | User Action                                                              | System / Team Action                          | Pain Point                                         | Desired Outcome                                     |
|--------------------|--------------------------------------------------------------------------|-----------------------------------------------|----------------------------------------------------|-----------------------------------------------------|
| Need               | Student/teacher identifies Wi-Fi, hardware, access or performance issue. | —                                             | Issue needs support.                               | Clear path to submit a ticket.                      |
| Ticket Creation    | Enters Caller and Short Description.                                     | Record is created.                            | Manual review would add delay.                     | Ticket is captured immediately.                     |
| Classification     | Waits for support.                                                       | Flow evaluates keywords in Short Description. | Incorrect/manual classification can delay routing. | Category and Subcategory assigned automatically.    |
| Notification       | Receives confirmation.                                                   | Flow sends email to Caller → Email.           | No acknowledgement can cause uncertainty.          | Caller receives ticket confirmation.                |
| Resolution Process | Waits for IT support.                                                    | IT team uses structured ticket data.          | Poor classification may affect routing.            | Correctly categorized ticket is ready for handling. |

### 3. Journey Success Criteria

- A new incident record can be created with caller and short description.
- The Flow triggers when the record is created and Category is empty.
- Wi-Fi/network, projector, password/login, and slow/hanging keywords produce the intended classification.
- The caller receives the configured email notification.
- Ticket information remains structured through Category, Subcategory and State choices.
