

PHASE 3 – PROJECT DESIGN

Problem – Solution Fit

Field	Details
Team ID	6ab4c3e86603573ccfb5068c
Project Name	Auto Ticket Classification using Flow Designer
Platform	ServiceNow
Maximum Marks	4 Marks

1. Problem–Solution Fit

The problem–solution fit connects the school IT helpdesk's manual classification problem with the configured ServiceNow Flow Designer automation.

Identified Problem	Proposed Solution	Expected Effect
Manual review of each incident	Record Created Flow automatically evaluates Short Description	Less repetitive work for IT staff
Inconsistent category selection	Standard Category choices	More consistent ticket data
Subcategory may not match category	Dependent Subcategory field	Improved data integrity
Common issues require repeated classification	Keyword-based If/Else If rules	Faster classification for supported issues
Caller may not know whether ticket was acknowledged	Send Email action	Automatic acknowledgement
Increasing ticket volume increases manual effort	No-code Flow Designer automation	Better scalability

2. Core Need and Fit

Design Aspect	Project Definition
User Behavior	Caller submits an issue description and waits for support.
Core Need	Correct and timely classification of common IT incidents.
Proposed Behavior	Record creation triggers automated keyword evaluation.
Solution Fit	Flow Designer maps issue keywords to standardized Category/Subcategory choices.
Expected Benefit	Reduced manual classification and improved routing consistency.

3. Fit Assessment

The solution stays within the project scope: it automates classification and notification using ServiceNow Flow Designer rather than introducing machine learning or external services.
