1. INTRODUCTION

1.1 Project Overview

This project, "Auto Ticket Classification using Flow Designer," implements a ServiceNow no-code automation for a school IT helpdesk. The system stores IT incident requests in a structured custom table and automatically classifies newly created tickets based on predefined keywords in the Short Description.

1.2 Purpose

The purpose is to reduce manual review, improve ticket routing efficiency, standardize Category and Subcategory values, and send an automated acknowledgement to the caller.

2. IDEATION PHASE

2.1 Problem Statement

The school IT helpdesk receives Wi-Fi, projector, password and performance-related requests. Manual review and classification is time-consuming and can be inconsistent as ticket volume grows.

2.2 Empathy Map

Requesters want quick acknowledgement and correct routing; helpdesk staff want standardized ticket data and less repetitive classification work.

2.3 Brainstorming

The selected idea was keyword-based ticket classification using ServiceNow Flow Designer, supported by dependent choices and email notification.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey

Student/Teacher → Ticket Creation → Record Created Trigger → Keyword Classification → Category/Subcategory Update → Email Acknowledgement → Helpdesk Handling.

3.2 Solution Requirements

Key requirements include structured ticket fields, four Category values, four Subcategory values, dependent choices, Record Created automation, keyword classification and caller email notification.

3.3 Data Flow

The Short Description is the main classification input. Flow Designer evaluates it and writes the classification back to the Incident Workflow record.

3.4 Technology Stack

ServiceNow, custom Incident Workflow table, ServiceNow Flow Designer, Record Created trigger, If/Else If flow logic, Update Record action, Send Email action and standard reference/choice fields.

4. PROJECT DESIGN

4.1 Problem-Solution Fit

The no-code Flow Designer solution directly targets repetitive manual classification without introducing machine learning or external infrastructure.

4.2 Proposed Solution

For Wi-Fi/Network → Network/Wi-Fi; Projector → Hardware/Projector; Password/Login → Access/Forgot Password; Slow/Hanging → Performance/Slow Computer.

4.3 Solution Architecture

Caller	→	Incident Workflow	→	Flow Designer	→	Update Classification	→	Email
--------	---	-------------------	---	---------------	---	-----------------------	---	-------

5. PROJECT PLANNING & SCHEDULING

The sequence is: understand problem → define requirements → create table/fields → configure dependency → build Flow → configure notification → activate → test → document.

6. FUNCTIONAL AND PERFORMANCE TESTING

Parameter	Method	Acceptance Condition	Actual
Wi-Fi classification	Create ticket with WiFi keyword	Network / WiFi	Documented in source project
Projector classification	Create ticket with Projector keyword	Hardware / Projector	Documented in source project
Password classification	Create ticket with Password/Login	Access / Forgot Password	To be recorded
Performance classification	Create ticket with Slow/Hanging	Performance / Slow Computer	To be recorded
Email notification	Inspect email logs	Caller receives notification	Documented for supplied scenarios

7. RESULTS

The supplied project documentation records two validation scenarios. "WiFi not working in library" is automatically classified as Network/WiFi and an email is sent. "Projector not turning on" is automatically classified as Hardware/Projector and an email is sent.

8. ADVANTAGES & DISADVANTAGES

Advantages	Disadvantages / Limitations
Reduces manual classification	Keyword matching is limited to configured vocabulary.
Improves consistency	New issue patterns require rule updates.
No-code and maintainable	Not a machine-learning classifier.
Automatic email acknowledgement	Email delivery depends on ServiceNow configuration.
Dependent choices improve data quality	Core scope covers only the configured issue categories.

9. CONCLUSION

The Auto Ticket Classification using Flow Designer project provides a complete no-code automation for common school IT incidents. It combines structured data capture, dependent choices, keyword-based Flow Designer logic and email notification to reduce manual work and improve routing consistency.

10. FUTURE SCOPE

- Add more keywords and incident categories.
- Introduce assignment-group automation for each category.
- Add SLA tracking and escalation.
- Add dashboards and classification analytics.
- Integrate predictive intelligence or ML after the rule-based baseline is stable.
- Improve notification templates and status updates.

11. APPENDIX

Item	Entry
Source Code	Not applicable; implementation is configured in ServiceNow Flow Designer.
Dataset Link	Not applicable.
GitHub Link	To be added if the team creates a repository.
Project Demo Link	To be added after demonstration is recorded/published.
Screenshot Evidence	Insert actual ServiceNow screenshots from the team implementation/UAT in the final submission copy.
