

PHASE 1 – IDEATION

Brainstorming – Idea Generation – Prioritization

Field	Details
Team ID	6ab4c3e86603573ccfb5068c
Project Name	Auto Ticket Classification using Flow Designer
Platform	ServiceNow
Maximum Marks	4 Marks

1. Purpose

This document applies the supplied brainstorming and prioritization template to the school IT helpdesk ticket-classification project. The goal is to select a feasible no-code ServiceNow solution that reduces manual classification effort.

2. Define the Problem

The school IT helpdesk receives multiple incident requests involving Wi-Fi, projector failures, password problems and slow computers. Staff currently review each request manually and select the category and subcategory, which is time-consuming and can lead to inconsistent routing.

3. Brainstorming Rules

- Stay on topic
- Defer judgment
- Go for volume
- Encourage ideas
- Listen to others
- Make ideas visible where possible

4. Idea Generation

Participant	Ideas
Person 1	Keyword-based ticket classification; simple incident form; standardized categories
Person 2	Automatic Network/Hardware/Access/Performance classification; dependent subcategories
Person 3	Flow Designer automation; record-created trigger; update record action
Person 4	Automatic assignment; notification to caller; structured ticket records
Person 5	Reporting dashboard; SLA monitoring; classification history
Person 6	Future predictive intelligence; analytics; broader issue vocabulary

5. Idea Listing & Grouping

Idea Group	Ideas
Classification Automation	Keyword matching; automatic category; automatic subcategory
Data Standardization	Choice fields; dependent Category/Subcategory; State values
Workflow Automation	Record Created trigger; conditional branches; Update Record
Communication	Automatic email confirmation to caller
Future Enhancements	SLA monitoring; dashboards; predictive intelligence

6. Idea Prioritization

Idea	Importance	Feasibility	Project Relevance
Automatic ticket classification	High	High	Directly removes manual categorization
Dependent subcategory selection	High	High	Improves data consistency
Flow Designer keyword rules	High	High	Fits the no-code requirement
Caller email notification	Medium	High	Meets communication requirement
SLA/dashboard integration	Medium	Medium	Useful future enhancement
Predictive intelligence	Low/Medium	Low	Outside current no-code scope

7. Selected Project Idea

Auto Ticket Classification using ServiceNow Flow Designer.

The selected solution uses a Record Created trigger and keyword-based conditional logic to classify the short description into Network/Wi-Fi, Hardware/Projector, Access/Forgot Password, or Performance/Slow Computer. The flow then sends an email confirmation.

8. Reason for Selection and Expected Outcome

The idea directly addresses the stated helpdesk problem, is implementable with ServiceNow Flow Designer, requires no machine-learning model, and supports structured category/subcategory data. It is expected to reduce manual effort and improve routing consistency.

9. Link to Next Phase

The selected idea is carried into Requirement Analysis to define the requester journey, user stories, data flow, solution requirements and technology stack.
