

PHASE 1 – IDEATION

Empathy Map Canvas

Field	Details
Team ID	6ab4c3e86603573ccfb5068c
Project Name	Auto Ticket Classification using Flow Designer
Platform	ServiceNow
Maximum Marks	4 Marks

1. Purpose

The empathy map captures the perspective of the primary requester and helpdesk user around submitting and tracking a school IT support ticket.

2. Empathy Map – IT Ticket Requester

Area	Project-specific content
Says	"I want my issue to be routed correctly." "I want confirmation that my ticket was created."
Thinks	"Will the helpdesk understand my issue?" "Has my request been classified correctly?"
Does	Creates a ticket, enters a short description, waits for acknowledgement and support.
Feels	Concerned when support is delayed; satisfied when the issue is acknowledged and routed consistently.
Pains	Manual classification, wrong category, delayed routing, repeated follow-up.
Needs / Gains	Fast acknowledgement, consistent classification, correct category/subcategory and a predictable support process.

3. Helpdesk Perspective

Area	Helpdesk view
Says	"We need tickets to arrive with the correct issue type."
Thinks	"Manual classification takes time and can be inconsistent."
Does	Reviews ticket descriptions, selects category/subcategory and communicates with callers.
Feels	Overloaded when ticket volume increases; confident when classification is standardized.
Pains	Repeated manual classification and avoidable routing errors.
Needs / Gains	Automatic classification, structured records and reduced repetitive work.

4. Key Insight

Both requester and helpdesk benefit from a predictable transition from ticket creation to correct classification. This supports the selected Flow Designer automation.
